

## Structure

## **Data Types**

Data types are defined as the data storage format that a variable can store a data.

- C language has built-in datatypes like primary and derived data types.
- ▶ But, still not all real world problems can be solved using those data types.
- We need custom datatype for different situation.

## **User Defined Datatype**

We need combination of various datatypes to understand different entity/object.

▶ Example-1:

→ Book

Title: Let Us C

**Author**: Yashavant Kanetkar

**Page**: 320

**Price**: 255.00

Example-2:

**→** Student

Name: ABC

**Roll\_No**: 180540107001

**CPI**: 7.46

Backlog: 01

Datatype: char / string

Datatype: char / string

Datatype: int

Datatype: float

Datatype: char / string

Datatype: int

Datatype: float

Datatype: int

## What is Structure?

- Structure is a collection of logically related data items of different datatypes grouped together under single name.
- Structure is a user defined datatype.
- Structure helps to build a complex datatype which is more meaningful than an array.
- But, an array holds similar datatype record, when structure holds different datatypes records.
- ▶ Two fundamental aspects of Structure:
  - Declaration of Structure Variable
  - Accessing of Structure Member

## **Syntax to Define Structure**

- ▶ To define a structure, we need to use **struct** keyword.
- This keyword is reserved word in C language. We can only use it for structure and its object declaration.

```
syntax

1 struct structure_name
2 {
3    member1_declaration;
4    member2_declaration;
5    . . .
6    memberN_declaration;
7 };

memberN_declaration

memberN_declaration

memberN_declaration

memberN_declaration
```

- Members can be normal variables, pointers, arrays or other structures.
- Member names within the particular structure must be distinct from one another.

## **Example to Define Structure**

```
1 struct student
2 {
3     char name[30]; // Student Name
4     int roll_no; // Student Roll No
5     float CPI; // Student CPI
6     int backlog; // Student Backlog
7 };
```

- ▶ You must terminate structure definition with semicolon ;.
- ▶ You cannot assign value to members inside the structure definition, it will cause compilation error.

## **Create Structure variable**

- A data type defines various properties about data stored in memory.
- To use any type we must declare its variable.
- ▶ Hence, let us learn how to create our custom structure type objects also known as structure variable.
- ▶ In C programming, there are two ways to declare a structure variable:
  - 1. Along with structure definition
  - 2. After structure definition

## **Create Structure Variable – Cont.**

#### 1. Declaration along with the structure definition

```
1 struct structure_name
2 {
3    member1_declaration;
4    member2_declaration;
5    . . .
6    memberN_declaration;
7 } structure_variable;
```

# 1 struct student 2 { 3 char name[30]; // Student Name 4 int roll\_no; // Student Roll No 5 float CPI; // Student CPI 6 int backlog; // Student Backlog 7 } student1;

## **Create Structure Variable – Cont.**

#### 2. Declaration after Structure definition

```
Syntax

1 struct structure_name structure_variable;
```

#### Example

```
1 struct student
2 {
3     char name[30]; // Student Name
4     int roll_no; // Student Roll No
5     float CPI; // Student CPI
6     int backlog; // Student Backlog
7 };
8 struct student student1; // Declare structure variable
```

## Access Structure member (data)

- Structure is a complex data type, we cannot assign any value directly to it using assignment operator.
- ▶ We must assign data to individual structure members separately.
- C supports two operators to access structure members, using a structure variable.
  - 1. Dot/period operator (.)
  - 2. Arrow operator (->)

## Access Structure member (data) – Cont.

#### 1. Dot/period operator (.)

→ It is known as member access operator. We use dot operator to access members of simple structure variable.

#### Syntax

1 structure\_variable.member\_name;

#### Example

- 1 // Assign CPI of student1
- 2 student1.CPI = 7.46;

#### 2. Arrow operator (->)

- → In C language it is illegal to access a structure member from a pointer to structure variable using dot operator.
- → We use arrow operator to access structure member from pointer to structure.

#### Syntax

1 pointer\_to\_structure->member\_name;

#### Example

- 1 // Student1 is a pointer to student type
- 2 student1 -> CPI = 7.46;

#### Write a program to read and display student information using structure.

#### Program

```
#include <stdio.h>
    struct student
         char name[40]; // Student name
         int roll; // Student enrollment
         float CPI; // Student mobile number
         int backlog;
    };
    int main()
         struct student student1; // Simple structure variable
         // Input data in structure members using dot operator
         printf("Enter Student Name:");
         scanf("%s", student1.name);
         printf("Enter Student Roll Number:");
         scanf("%d", &student1.roll);
         printf("Enter Student CPI:");
         scanf("%f", &student1.CPI);
         printf("Enter Student Backlog:");
         scanf("%d", &student1.backlog);
         // Display data in structure members using dot operator
         printf("\nStudent using simple structure variable.\n");
         printf("Student name: %s\n", student1.name);
         printf("Student Enrollment: %d\n", student1.roll);
         printf("Student CPI: %f\n", student1.CPI);
         printf("Student Backlog: %i\n", student1.backlog);
27 }
```

```
Enter Student Name:aaa
Enter Student Roll Number:111
Enter Student CPI:7.89
Enter Student Backlog:0

Student using simple structure variable.
Student name: aaa
Student Enrollment: 111
Student CPI: 7.890000
Student Backlog: 0
```

#### Write a program to declare time structure and read two different time period and display sum of it.

#### Program

```
#include<stdio.h>
  struct time {
       int hours;
       int minutes;
       int seconds;
6 };
  int main() {
       struct time t1,t2;
       int h, m, s;
       //1st time
       printf ("Enter 1st time.");
       printf ("\nEnter Hours: ");
       scanf ("%d",&t1.hours);
       printf ("Enter Minutes: ");
       scanf ("%d",&t1.minutes);
       printf ("Enter Seconds: ");
       scanf ("%d",&t1.seconds);
       printf ("The Time is
       %d:%d:%d",t1.hours,t1.minutes,t1.seconds);
       //2nd time
       printf ("\n\nEnter the 2nd time.");
       printf ("\nEnter Hours: ");
       scanf ("%d",&t2.hours);
       printf ("Enter Minutes: ");
       scanf ("%d",&t2.minutes);
       printf ("Enter Seconds: ");
```

```
Enter 1st time.
Enter Hours: 1
Enter Minutes: 20
Enter Seconds: 20
The Time is 1:20:20

Enter the 2nd time.
Enter Hours: 2
Enter Minutes: 10
Enter Seconds: 10
The Time is 2:10:10
Sum of the two time's is 3:30:30
```

## **Array of Structure**

- It can be defined as the collection of multiple structure variables where each variable contains information about different entities.
- The array of structures in C are used to store information about multiple entities of different data types.

```
Syntax

1 struct structure_name
2 {
3    member1_declaration;
4    member2_declaration;
5    ...
6    memberN_declaration;
7 } structure_variable[size];
```

#### Write a program to read and display N student information using array of structure.

#### Program

```
#include<stdio.h>
    struct student {
         char name[20];
         int rollno;
         float cpi;
   };
    int main( ) {
         int i,n;
         printf("Enter how many records u want to store : ");
         scanf("%d",&n);
         struct student sarr[n];
         for(i=0; i<n; i++)</pre>
              printf("\nEnter %d record : \n",i+1);
              printf("Enter Name : ");
              scanf("%s",sarr[i].name);
              printf("Enter RollNo. : ");
              scanf("%d",&sarr[i].rollno);
              printf("Enter CPI : ");
              scanf("%f",&sarr[i].cpi);
         printf("\n\tName\tRollNo\tMarks\t\n");
         for(i=0; i<n; i++) {</pre>
              printf("\t%s\t\t%d\t\t%.2f\t\n", sarr[i].name,
              sarr[i].rollno, sarr[i].cpi);
         return 0;
28 }
```

```
Enter how many records u want to store : 3
Enter 1 record:
Enter Name : aaa
Enter RollNo.: 111
Enter CPI: 7.89
Enter 2 record:
Enter Name : bbb
Enter RollNo.: 222
Enter CPI: 7.85
Enter 3 record:
Enter Name : ccc
Enter RollNo.: 333
Enter CPI: 8.56
            RollNo Marks
    Name
            111
                    7.89
    aaa
    bbb
            222
                    7.85
                    8.56
            333
    \mathsf{CCC}
```

#### Write a program to declare time structure and read two different time period and display sum of it using function.

#### Program

```
#include<stdio.h>
struct Time {
     int hours;
     int minutes;
     int seconds;
};
struct Time input(); // function declaration
int main()
     struct Time t;
     t=input();
     printf("Hours : Minutes : Seconds\n %d : %d :
    %d",t.hours,t.minutes,t.seconds);
     return 0;
struct Time input() // function definition
     struct Time tt;
     printf ("Enter Hours: ");
     scanf ("%d",&tt.hours);
     printf ("Enter Minutes: ");
     scanf ("%d",&tt.minutes);
     printf ("Enter Seconds: ");
     scanf ("%d",&tt.seconds);
     return tt; // return structure variable
```

```
Enter Hours: 1
Enter Minutes: 20
Enter Seconds: 20
Hours: Minutes: Seconds
1: 20: 20
```

## **Structure** using Pointer

Reference/address of structure object is passed as function argument to the definition of function.

#### Program #include <stdio.h> struct student { char name[20]: int rollno; float cpi: **}**; int main() struct student \*studPtr, stud1; studPtr = &stud1; printf("Enter Name: "); scanf("%s", studPtr->name); printf("Enter RollNo: "); scanf("%d", &studPtr->rollno); printf("Enter CPI: "); scanf("%f", &studPtr->cpi); printf("\nStudent Details:\n"); printf("Name: %s\n", studPtr->name); printf("RollNo: %d", studPtr->rollno); printf("\nCPI: %f", studPtr->cpi); return 0; 22 }

```
Enter Name: ABC
Enter RollNo: 121
Enter CPI: 7.46

Student Details:
Name: ABC
RollNo: 121
CPI: 7.460000
```

## **Nested Structure**

- ▶ When a structure contains another structure, it is called nested structure.
- ▶ For example, we have two structures named Address and Student. To make Address nested to Student, we have to define Address structure before and outside Student structure and create an object of Address structure inside Student structure.

### Syntax struct structure\_name1 member1\_declaration; member2 declaration; memberN declaration; struct structure name2 member1\_declaration; member2 declaration; struct structure1 obj; 14 };

#### Write a program to read and display student information using nested of structure.

#### Program

```
#include<stdio.h>
struct Address
     char HouseNo[25];
     char City[25];
     char PinCode[25];
};
struct Student
     char name[25];
     int roll;
     float cpi;
     struct Address Add;
};
int main()
     int i;
     struct Student s;
     printf("\n\tEnter Student Name : ");
     scanf("%s",s.name);
     printf("\n\tEnter Student Roll Number : ");
     scanf("%d",&s.roll);
     printf("\n\tEnter Student CPI : ");
     scanf("%f",&s.cpi);
     printf("\n\tEnter Student House No : ");
     scanf("%s",s.Add.HouseNo);
```

```
printf("\n\tEnter Student City : ");
   scanf("%s",s.Add.City);
   printf("\n\tEnter Student Pincode : ");
   scanf("%s",s.Add.PinCode);
   printf("\nDetails of Students");
   printf("\n\tStudent Name : %s",s.name);
   printf("\n\tStudent Roll Number :
34 %d",s.roll);
   printf("\n\tStudent CPI : %f",s.cpi);
   printf("\n\tStudent House No :
37 %s", s. Add. HouseNo);
38 printf("\n\tStudent City :
39 %s",s.Add.City);
40 printf("\n\tStudent Pincode :
41 %s", s. Add. PinCode);
42 return 0;
43 }
```

```
Details of Students
Student Name : aaa
Student Roll Number : 111
Student CPI : 7.890000
Student House No : 39
Student City : rajkot
Student Pincode : 360001
```

## **Practice Programs**

- Define a structure data type called time\_struct containing three member's integer hours, minutes, second. Develop a program that would assign values to individual member and display the time in following format: HH:MM:SS
- 2. WAP to create structure of book with book title, author name, publication, and price. Read data of n books and display them.
- 3. Define a structure Person that would contain person name, date of joining, and salary using this structure to read this information of 5 people and print the same on screen.
- 4. Define a structure time\_struct containing three member's integer hour, integer minute and integer second. WAP that would assign values to the individual number and display the time in the following format: 16: 40: 51.
- 5. Define a structure cricket that will describe the following information:
  - Player name
  - Team name
  - Batting average
- 6. Using cricket, declare an array player with 50 elements and WAP to read the information about all the 50 players and print team wise list containing names of players with their batting average.
- 7. Define a structure student\_record to contain name, branch, and total marks obtained. WAP to read data for 10 students in a class and print them.

Prof. Rahul Sharma (PPS) – Structure 20

# Thank you
